

VALUE LADDER — where the board, the analysts and the depth chart agree

JUG, slot 8 · built Sep 07 2026, 12:59 · research sheet, NOT a draft-night artifact — the board is still the one list you draft from.

Read this as an agreement count, not a model. Every signal here except **BOARD** is unpriced and unmeasured in this project. Three separate tests looked for a link between “the analysts like him more than the market does” and “he actually beat his projection.” **A perfect link scores 1.0 and no link scores 0. All three came back between –0.08 and –0.24** — no link at all, and the sign is *backwards*: the players who looked like the shortest bargains did slightly **worse**. For scale, the signals this project does trust score **+0.40 to +0.59**. What these rows give you is **where several independent sources happen to point the same way** — a shortlist to research, not a ranking to obey. **still there** is the chance he lasts to that pick, from ADP dispersion alone (\$4.12’s noise, no opponent model). \$4.15 measured that this family of number runs **optimistic** — on Josh Allen it read 74% where the calibrated answer was 3%, because it cannot know that Snyder takes Allen at his turn. **Treat every one of these as a ceiling**. The live board’s **still there?** column is the same idea computed a different way (a 400-run simulation on the players actually left) and carries the same optimism — do not read one as a check on the other.

BOARD greyed on purpose — our projection likes him more than the market does, which is the signal this project **RETIRED**. See the note below · **ANALYSTS** Boone and Harmon’s **RANKINGS** both 25+ slots ahead of ADP · **BUY** the analyst **COMMENTARY** sweep called him up — a different source from **ANALYSTS**, not the same thing said twice · **JOB** unsettled or contested job worth having · **INJURY-OPENED** a teammate at his position is **OUT** / **PUP** / exempt

Cautions in orange, all from the injury sweep: **AVOID** = do not draft him at this price · **DISC** = discount — he is worth taking later than this rank, not here · **played N** = he played N games in 2025, and **the number is the warning, not the badge** (\$4.22e: an 11-game season cost –17 points against his projection, a 4-game season –41) · **bear** = the analyst commentary leans against him.

THE BADGES ARE NOT EQUAL, SO READ THEM IN THIS ORDER. INJURY-OPENED is the only FACT — a teammate at his position is actually out, so the path already changed. **JOB is a SIZE** — the job is open and worth this many points to whoever wins it; measured on 19 unsettled backfields it does *not* tell you who wins. **ANALYSTS and BUY are OPINION**, from two different sources. **BOARD is greyed out and is NOT counted in AGREE**: it fires when our projection likes him more than the market does — the “market is sleeping on him” idea this project **retired**, then measured again at **–0.17** (n=409) pointing the *wrong* way. It also fires on **40 of these 49 rows**, so it separates almost nothing. It is shown because the disagreement is worth seeing, **not** because it is a reason to draft him.

So: rows are ordered by the FACT first, then AGREE (the four non-BOARD badges), then by how big the open job is, then by the analyst gap. Everything inside one **PICK** block is reachable at the same pick, so this is a **reading order, not a ranking** — and deliberately not by **VBD** or board rank, because that is the draft board’s job and a second copy of it would be worse. Ranking by value is the draft board’s job; this sheet answers a different question, which is where several independent things happen to point at the same name.

vbd is points above a replacement starter — the same number the draft board sorts on, so a row here lines up against that page. **brd #** is his rank on it, and the **BOARD** badge is exactly “brd # is 12+ better than adp”, so you can check it in place.

UNSETTLED / contested tells you the job is open, NOT who wins it. Measured on 19 such backfields (2022 + 2024): the incumbent and the challenger beat their price by the same amount on average, and individual pairs swing ±110 points either way — Brooks lost his job to Dowdle, and Pollard kept his over Spears, by the same margin. **Buy the job, never the name**.

still there is a ceiling, never a check on the live board’s column of the same name — they answer different questions (here: is he there when you **ARRIVE**; there: is he there at your **NEXT** turn if you pass).
